The selnolig package: Selective suppression of typographic ligatures*

Mico Loretan[†]

2012/12/26

Abstract

The seinolig package lets users suppress typographic ligatures based on predefined search patterns. The search patterns focus on ligatures deemed inappropriate because they span morpheme boundaries. For example, the word shelfful, which is mentioned in the TEXbook as a word for which the "ff" ligature might be inappropriate, is automatically typeset as shelfful rather than as shelfful.

For English and German language documents, the seinolig package provides ligature suppression macros for the "common" f-ligatures. These comprise not only the familiar ff, fi, fl, ffl, and ffl ligatures but also the ft and fft ligatures.

For English language documents, the package further provides ligature suppression macros for a number of so-called "discretionary" and "historic" ligatures.

The selnolig package requires the LualATEX format provided by a reasonably modern TEX distribution such as TEXLive 2012, MacTEX 2012, or MiKTEX 2.9.

^{*}Current version: 0.168. Features of the selnolig package are subject to change without prior notice.

The main text fonts used in this document are "Garamond Premier Pro" (for the most part) and "EB Garamond" (for the passages involving the fb, fh, fk, ffb, ffh, ffk, and sk ligatures). Both "common" and "discretionary" typographic ligatures are enabled for these two fonts—and suppressed selectively using selnolig's macros.

1 Introduction

The ability of TEX and Friends to use typographic ligatures has long been cherished by its users. Indeed, the automated and transparent use of typographic ligatures by TEX and Friends is often offered up as one of the reasons for using these programs to obtain high-quality typeset output.

However, even though the automatic use of typographic ligatures is highly desirable in general, there are words for which the use of certain typographic ligatures may not be appropriate. The TEXbook observes, on p. 19, that the word "shelfful" may look better if it is typeset as "shelfful", i.e., without the ff-ligature. Some other English-language words that would generally be considered to be good candidates for non-use of ligatures are cufflink and offload; compare their appearance with that of cufflink and offload. Observe that all of these words are composite: the first word component (or morpheme) ends in an "f" or "ff", and the second component (morpheme) beginning with either an "f" (in the case of shelfful) or an "l" (in the cases of cufflink and offload). A morpheme, briefly stated, is the smallest linguistic unit within a word that bears distinct meaning. Thus, the words shelfful and offload each contain two morphemes.

On the whole, though, the need to suppress typographic ligatures selectively for English language documents generally does not appear to be an enormously pressing concern, possibly because English doesn't feature composite words that frequently. However, in other languages, such as German, composite words are much more common; in these languages, there is naturally a much greater potential for composite words to feature f-f, f-l, and f-i (and other such character pairs and triples) across morpheme boundaries. In German typography, the use of ligatures across morpheme boundaries is considered something to be avoided at (nearly) all cost, probably because ligatures that span morphemes have the potential to impair seriously the intelligibility of these words. Words such as elffach and kopflos (containing ff- and fl-ligatures) simply look wrong to a German reader; they should be typeset as elffach and kopflos, respectively.

TEX and Friends offer several methods for suppressing ligatures on a case-by-case basis.² However, these methods must be applied separately to each and every occurrence of all words that contain undesirable ligatures. As such, these methods are both time-intensive and tedious, and there's a residual risk that some words for which ligatures should be suppressed will be overlooked in the editing process.

¹For German texts, I believe that the *Duden* provides authoritative backing for questions related to selective ligature suppression. For English texts, I'm actually not aware of a document issued by an official or quasi-official body that discourages the use of typographic ligatures across morpheme boundaries. If anybody can provide such a reference, I would be happy to list it.

²In LTEX, there are three basic methods for suppressing ligature within a character pair: (i) insertion of an "empty atom", {} between the characters, (ii) insertion of an explicit italic correction, \/, and (iii) insertion of an explicit "kern", e.g., \kern@pt or \hspace{@pt}. The babel package, when used with the ngerman option, offers the "shortcut" macro " | for this purpose. Note, though, that the first ligature suppression method, {}, does *not* work if the document is compiled with Lual-TEX.

What has *not* been available so far is a LaTEX package that (i) specifies a list of word patterns and entire words for which ligatures should be suppressed and (ii) systematically discovers all instances of these words in a document and applies the non-ligation rules automatically. The selnolig package is meant to address this need. The package is currently set up to handle English and German language non-ligation issues by providing extensive lists of ligature suppression macros appropriate for the respective languages. Of course, no claim as to the completeness of either list is made—or can be made. The package attempts to make it fairly easy for users to provide additional ligature suppression rules to treat words not already covered by the package.³

For both English and German language documents, the selnolig package provides macros to suppress selectively the following f-ligatures: ff, fi, fl, ffi, and ffl—the "standard" f-ligatures that should be familiar to most users of Computer Modern fonts—as well as the ft (or ft) and fft ligatures. The latter two ligatures, while not provided by the Computer Modern font family, are available frequently in "oldstyle" or "Garalde" font families.

For English language documents, the package's default setting is to suppress f-ligatures for only a fairly basic set of words. However, if the package's broadf option is set, additional f-ligatures can be suppressed, e.g., for words that contain the fb, fh, fj, and fk character pairs. The package also features an option called hdlig. If this option is set, the package will suppress selectively historic and discretionary ligatures, such as those for the ct, st, sp, sk, th, et, and as character pairs.

For German language documents, all instances of fb, fh, fj, and fk ligatures are suppressed globally; see Section 6.5 for more details. However, exceptions are provided in order *not* to suppress these ligatures for selected words of *non-German* origin—such as fjord, fjell, Prokofjew, and Kafka. At this time, no macros for the selective suppression of historic and/or discretionary ligatures are provided for German language documents.

The selnolig package also provides additional hyphenation exception lists for both English and German language words. These words are generally composite and contain one more typographic ligatures that should be suppressed.

A remark on the classification of various forms of typographic ligatures: Among the ligature-rich OpenType fonts I'm familiar with that can be loaded via the commands of the fontspec package, there appears to a near-complete lack of terminological standardization as to which typographic ligatures—beyond the so-called "common" ligatures (mainly f-ligatures)—are labelled "historic" and which ones are labelled "discretionary". The fonts Latin Modern Roman, Garamond Premier Pro, and Hoefler Text report having "only" discretionary ligatures, whereas Junicode, Cardo, EB Garamond, and Palatino Linotype report featuring both historic and discretionary ligatures. Interestingly, none of these fonts report having ligatures classified as either "contextual" or "required".

³ If you discover such words, please email them to me so that I can augment and update the package's ligature suppression rules accordingly. A suggested template for reporting such cases is provided in Appendix E.

2 I'm in a hurry! How do I start using this package?

2.1 How do I load the selnolig package?

• If your document is in English and you want to suppress f-ligatures for a "basic" set of words and word patterns, you should load the package as follows:

```
\usepackage[english]{selnolig}
```

Synonymous options for english are UKenglish, british, USenglish, american, canadian, australian, and newzealand.

- If you want to load a broader set of f-ligature suppression rules than the set that's enabled by default, be sure to also specify the broadf option; see Section 6.2.1.
- If the font you use for your document also provides "historic" and/or "discretionary" ligatures (e.g., &t, st, st, th, as, is, us, etc.), you should also specify the hdlig option (in addition to the english option, of course) when loading the selnolig package.⁴
- If your document is written in German, load the package as follows:

```
\usepackage[ngerman]{selnolig}
```

Synonymous options are german, austrian, naustrian, swissgerman, and swiss.

• If you load the package without an explicit language option, i.e., as

```
\usepackage{selnolig}
```

but if one or more of the language options noted above are specified as options to the \documentclass instruction, LTEX will pass these options on to the selnolig package.

• If no language options are set, either when the package is loaded or as options in the \documentclass instruction, loading the selnolig package will have no effect on the appearance of your document—unless you specify various \nolig macros on your own.

⁴If the semolig package is loaded *after* the fontspec package, a macro is run to inquire if historic and/or discretionary ligatures are enabled; if the answer is yes, the hdlig option is enabled automatically.

2.2 Any hints on how to get started with LuaLTEX?

The ligature suppression macros of the selnolig package *require* the use of the LuaL*TEX format. They will *not* work with pdfL*TEX or XEL*TEX. One can load the selnolig package under either pdfL*TEX or XEL*TEX, but then only the package's hyphenation exception patterns will be loaded; the ligature suppression macros won't be loaded because they are based on lua code. If it's not run under LuaL*TEX, the selnolig package will issue a warning message to the effect that its ligature suppression macros won't be running, but it will not terminate prematurely.

The requirement to use LuaETEX will likely force you to make some changes to the preambles of your existing ETEX documents. Fortunately, the required changes should be fairly minor and straightforward to implement because LuaETEX is, for the most part, a strict superset of pdfETEX. Almost all documents that compile correctly under pdfETEX should also compile correctly under LuaETEX as long as some relatively minor changes are made. The two main required changes are:

(i) don't load the inputence and fontence packages, and (ii) insert the instruction

\usepackage{fontspec}

in the preamble. If the fontspec package isn't loaded by the time the \begin{document} statement is encountered, selnolig will terminate with an error message. It is recommended (but not required) that you load selnolig *after* fontspec and the latter package's font- and ligature-related commands.

Of course, you'll also need to use a TEX distribution that includes a fairly recent version of LuaLTEX. TEXLive 2012, MacTEX 2012, and MiKTEX 2.9 all satisfy this requirement. The version of LuaLTEX distributed with TeXLive 2011 is probably sufficiently recent to meet the package's requirements, but the version distributed with TeXLive 2009 is almost certainly not.

If you use a command-line interface to compile your document named, say, myfile.tex, be sure to type

lualatex myfile

rather than latex myfile (or pdflatex myfile). If you use an editor with pull-down menus or buttons to invoke a suitable TEX compiler for your document, be sure to select LuaLaTeX.

The very first time one runs LuaLTEX on a document with a new set of fonts, the compilation speed will likely be quite slow because LuaLTEX has to build various cache files to store font-related information. Subsequent compilation runs should be much faster.

Depending on your TEX distribution, the default font family used by LuaETEX will be either Computer Modern or Latin Modern. If you wish to use a different font family, further instructions will be required. How to specify fonts and font families and set up various font-related options in LuaETEX are subjects that go far beyond the scope of this user guide. I urge you to become familiar with the user guide of the fontspec package to learn how to set a multitude of font-related options.

The answers to the questions Frequently loaded packages: Differences between pdf La LuaLTEX and LuaLTEX as a replacement for pdf TEX, both posted to tex.stackexchange.com,

provide some very useful information for people who are reasonably familiar with pdf LTEX but are new to LuaLTEX. Another great resource for people who would like to become more familiar with LuaLTEX is A Guide to LuaLTEX, written by Manuel Pégourié-Gonnard.

2.3 Anything else I need to do or know?

For multilingual support, Lual-TEX and the selnolig package work well with the babel package. If your document loads the babel package, be sure to load the selnolig package *after* the babel package, so that the additional hyphenation patterns provided by the selnolig package won't get clobbered by babel's hyphenation settings. The selnolig package is also compatible with the hyphsubst package (which, if used, should be loaded with a \RequirePackage statement *before* the \documentclass instruction).

Lual-TEX natively supports the so-called UTF-8 input encoding. The selnolig package assumes that users make full use of this feature. In particular, if your document is in German, it is assumed that all vowels with diereses (Umlaute) are entered as ä, ö, and ü rather than as \"{a}, \"{o}, and \"{u} (or, if you tend to use the babel "shortcuts", as "a, "o, and "u). Likewise, it's assumed that you enter the "Eszett" ("Scharfes s") character as ß rather than as {\ss}.

It is also assumed that you use the triple-f (modern) spelling form for words such as Schifffahrt, Stofffarbe, and grifffest.

Finally, all babel-style "| ligature-suppressing shortcut instructions should either be removed entirely or replaced with \breaklig instructions. On my LuaETEX system (MacTeX 2012), whenever a "| command is encountered, a bad crash occurs that requires a reboot of the computer.

3 Acknowledgments and license

I owe a huge intellectual and programming debt to Patrick Gundlach and Taco Hoekwater, who responded kindly and generously with detailed computer code to various queries I posted to tex.stackexchange.com. Without their expertise in programming in Lua and interfacing the lua code with Lack this package would not exist. They certainly deserve most of the credit for the lua code used by the selnolig package.

Felix Lehmann (a linguist and expert in morphology, i.e., the study of morphemes) and Steffen Hildebrandt (computer scientist extraordinaire) served as patient and careful testers of several early beta versions of this package, uncovering bugs, pointing out unclear passages in the user

^{&#}x27;Strictly speaking, the use of the input characters with "built-in" diereses is required only for the operations of the package's \nolig and \keeplig commands. However, if you're going to use the selnolig package, you may was well use \begin{a} \bar{e}, \bar{e}, and \bar{u} consistently throughout your document(s).

⁶See especially the questions http://tex.stackexchange.com/q/48516/5001, http://tex.stackexchange.com/q/63005/5001, and http://tex.stackexchange.com/q/37443/5001.

guide, writing scripts to automate the discovery of syntactic errors in the package's \nolig and \keeplig instructions, and providing many excellent suggestions for important enhancements and other improvements. Steffen provided crucial modifications to the package's lua code to make possible the \keeplig macro.

Even more importantly, Felix and Steffen created scripts to systematically and comprehensively test the package's German detection patterns for linguistic adequacy and (relative) completeness. [Still to come: a brief summary of what Felix and Steffen have found, and a reference or two to their published work.] They wish to thank the Institut für Maschinelle Sprachverarbeitung at the Universität Stuttgart for granting them a license for the morphological analysis tool SMOR and, in particular, Helmut Schmid for his guidance and the Web-as-Corpus kool ynitiative (WaCky) for letting them use the SdeWaC corpus.⁷ They also thank Rajesh Bhatt (University of Massachusetts–Amherst), Miriam Butt (Universität Konstanz), and Sabine Schulte im Walde (Universität Stuttgart) for helping them find the right resources for their project.

The rmligs script lists hundreds of German language words for which various f-ligatures should be suppressed. I created many of the initial German language ligature suppression rules of the selnolig package to treat the words listed in the rmligs package.⁸

Matthias Vogel very kindly informed me of a very useful and detailed set of macros, named Ligatures-German, which he wrote for the WinEdt programmer's editor, to suppress f-ligatures by inserting the babel "| shortcut macro in the appropriate spots. Matthias' regular-expression based macros and a file he sent me containing a very extensive list of German words that need one or more f-ligatures suppressed led me to thoroughly refine and extend the scope of the selnolig's ligature-suppressing commands for German words.

Barbara Beeton provided careful and incisive comments on an early version of this user guide and the English-language ligature suppression macros. Other contributors to tex.stackexchange. com and comp.text.tex, too numerous to name individually, also helped guide and influence the genesis of this package. To all of you, I express my sincere thanks.

The website http://www.morewords.com provides very convenient methods for searching English language words that may contain cases of ligature collisions across morpheme boundaries. For German words, the site http://corpora.informatik.uni-leipzig.de/?dict=de provides a similar resource.

The entire selnolig package is placed under the terms of the LATEX Project Public License, version 1.3 or later (http://www.latex-project.org/lppl.txt). It has the status "maintained".

⁷M. Baroni, S. Bernardini, A. Ferraresi and E. Zanchetta, 2009, The WaCky Wide Web: A Collection of Very Large Linguistically Processed Web-Crawled Corpora. *Language Resources and Evaluation*, 43 (3): 209–226.

⁸All versions of rmligs are archived at http://www.j3e.de/ispell/igerman98/dict/. A slightly modified version of the rmligs package's test file, now called rmligs-testfile.tex, is included among the ancillary files distributed with the selnolig package.

4 Structure of the package

4.1 Components of the package

The selnolig package has the following components:

- The main "driver" file is called selnolig.sty. It loads several other files and sets up the the package's main user macros, \nolig and \keeplig. These macros are explained in more detail in Section 4.2 below.
- The package's user macros rely on lua code contained in the file selnolig.lua.
- Extensive lists of non-ligation rules for English and German language documents are provided in the files selnolig-english-patterns.sty and selnolig-english-patterns.sty.
- Supplemental hyphenation exception patterns, mostly for words that involve one or more
 ligatures that are to be suppressed, are contained in the files selnolig-english-hyphex.sty and
 selnolig-english-hyphex.sty.
- A user guide (the document you're reading right now); the source code of the user guide is available in the file selnolig.tex.
- Ancillary files: the files selnolig-english-test.tex and selnolig-german-test.tex load the selnolig package as well as either selnolig-english-wordlist.tex or selnolig-german-wordlist.tex. They serve to demonstrate the output of the selnolig package when run on lists of English or German words that are candidates for non-use of ligatures. The files selnolig-english-test.pdf and selnolig-german-test.pdf contain the results of compiling the test programs.⁹

4.2 The package's user commands

The file selnolig.sty should be loaded with a \usepackage statement, generally with one or more options; see Section 6 for a discussion of the available options. After setting up several Boolean switches to structure the processing of options, the package next loads the file selnolig.lua, which contains the package's lua code.

The package then sets up several user macros which build on the lua code:

1. The main user macro is called \nolig. Each \nolig instruction takes two arguments: a search string and a string that indicates the insertion point for the non-ligation "whatsit". For example, the macro

⁹The two "test" files also load the package showhyphens to indicate automatically all instances where LuaETEX might insert hyphenation points.

```
\nolig{lfful}{lf|ful}
```

instructs LuaLTEX to suppress automatically the ff-ligature in words such as "shelfful", "bookshelfful", and "selffulfilling".

More than one ligature suppression point may be provided in the second argument of a \nolig instruction. 10

It is possible to use "wildcard" characters in the search string, as long as these characters occur after the non-ligation point. For example, the file selnolig-german-patterns.sty employs the instruction

```
\nolig{Aufl[aäeioöuü]}{Auf|1}
```

to search for words that start with Aufl followed by a vowel. Incidentally, it is not absolutely necessary, in the second argument of the \nolig command, to provide any material *after* the vertical bar. However, the readability of the \nolig instructions may suffer if you suppress that material.

If you examine the \nolig instructions provided in the files selnolig-german-patterns.sty and selnolig-english-patterns.sty, you'll notice quickly that there's some redundancy built into the package's ligature suppression rules. For instance, the need to suppress the ff-ligature in the German verb "auffallen" is catered to both by \nolig{auff}{auff} auf|f} and by \nolig{ffall}{ffall}. This redundancy is there by design, because not all words that might fit the first pattern will also fit the second pattern, and vice versa. Building in some redundancy seems like a reasonable way to proceed.

The arguments of the \nolig command, as well as of the package's other user commands, are case-sensitive.

2. The macro

```
\keeplig{<word-fragment>}
```

lets users override \nolig instructions, by specifying words and word fragments for which typographic ligatures should *not* be suppressed anywhere in the document. For a \keeplig macro to work properly, its argument should be a word (or word fragment) that includes as

¹⁰For instance, one *could* specify \nolig{Auflaufform}{Auf|lauf|form} to suppress both the fl and the ff ligature in this word. As I note in Section 7.2, the selnolig package actually uses two separate \nolig commands to treat the ligatures in Auflaufform.

¹¹This particular search string is used in order not to catch the abbreviated word "Aufl.", which does *not* get its fl-ligature suppressed.

a subset words (or word fragments) treated by \nolig instructions. It is permissible to use lua-type wildcard characters in the argument of \keeplig.

Having the \keeplig macro is very useful because it allows us to specify simpler, i.e., less restrictive, \nolig instructions: Any Type-II errors that may arise from having a slightly-too-broad \nolig macro can be addressed by providing judiciously chosen \keeplig macros.

To give an example: If the ngerman option is set, the package uses the macro

```
\nolig{flich}{f|lich}
```

to break up the fl-ligature in the words brieflich, tariflich, trefflich, hilflich, verwerflich, beruflich, sträflich, höflich, glimpflich, unerschöpflich, Lauflicht, and begrifflich—and quite a few more words too. This macro is, unfortunately, a bit too broad because it also operates on words such as Pflicht and verpflichten, for which the fl-ligature should *not* be suppressed. Rather than provide a plethora of slightly more restrictive \nolig macros just to avoid including the Pflicht- and pflicht-words, the package provides the commands

```
\keeplig{Pflicht}
\keeplig{pflicht}
```

to override the action of the \nolig{flich}{flich} instruction for words that contain these two word fragments. Recall that the argument of \keeplig is case-sensitive; hence, two \keeplig instructions are needed.

Just as it is possible to override the action of a \nolig command with a subsequent \keeplig command, it is also possible to override the action of a \keeplig macro with a more specific \nolig command. For instance, it turns out that the two \keeplig commands stated in the preceding paragraph are themselves a bit too broad because they also affect the typesetting of the composite word Sumpflicht (swamp light), for which the fl-ligature should be suppressed. To address this case, the file selnolig-german-patterns.sty provides the macro

```
\nolig{Sumpflicht}{Sumpf|licht}
```

Observe that we make use of the case sensitivity in the final \nolig instruction in order to avoid having it apply to words such as "Visumpflicht" (visa requirement).

3. The macro \breaklig, which doesn't take an argument, is provided as a hopefully easy-to-remember version of the low-level LATEX command \-\hspace{0pt}. As its name suggests, you should insert this macro in places where you want to break up a ligature on an ad-hoc basis (and also wish to permit hyphenation to occur). For instance, to sup-

press the *sk* ligature in the word groundskeeper on a one-off basis, one might enter it as "grounds breaklig keeper" to get *groundskeeper* rather than *groundskeeper*.¹²

Incidentally, the selnolig package does not provide a dedicated macro to override the action of a \nolig instruction on an ad hoc basis, i.e., to force the use of a typographic ligature on a one-off basis. The LATEX command \mbox{} already caters to this need.

The final few steps in the startup process depend on which language-related options are set:

- If *no* language-specific options are in effect, the loading process terminates. Users may still use the instructions \nolig, \keeplig, and \breaklig, but no lists of language-specific \nolig macros are loaded.
- If the english option (or one of its synonymous options) is set, the files selnolig-english-patterns.sty and selnolig-english-hyphex.sty are loaded. The former file contains a long list of \nolig macros adapted to English language typographic usage; Appendix C provides a complete listing of these macros. The latter file contains a list of hyphenation exceptions, mainly for words that contain one or more potential non-ligation points and for which TEX's hypenation algorithm either misses valid hyphenation points or selects invalid hyphenation points; see Section 6.2.2 below.
- If the ngerman option (or one of its synonymous options) is set, the files selnolig-german-patterns.sty and selnolig-german-hyphex.sty are loaded. The former file contains ligature-suppressing instructions appropriate for German typographic usage; Appendix D lists its contents. The latter file provides additional hyphenation rules for German-language words.
- If the user specifies both the english and ngerman options (or some of their synonymous options), *both* language-specific style files will be loaded. Under normal circumstances, a user will probably want to load only one or the other set of language-specific files, but not both sets.

5 The selnolig package's approach to breaking up ligatures

The \nolig macros provided in the files selnolig-english-patterns.sty (see Appendix C) and selnolig-german-patterns.sty (see Appendix D) are primarily designed to break up ligatures—mainly f-ligatures, but potentially other ligatures as well—across *morpheme* boundaries.

¹²To suppress the *Sk* ligature globally for this word, as well as for words such as *greenskeeper* and *miskeep*, one could issue the directive \nolig{skeep}{s|keep}. The selnolig package does so.

Issues of ligating character pairs and triples across morpheme boundaries can occur

- if two independent or "main words" (Stammwörter) are joined together: rooftop/rooftop, newspaper/newspaper, Schilffeld/Schilffeld, Brieftaube/Brieftaube;
- between a prefix and main word: mistrust/mistrust, display/display, aufleben/aufleben, auftun/auftun; and
- between a main word and a suffix: shelfful/shelfful, dwarflike/dwarflike, kopflos/kopflos, and Zöpflein/Zöpflein.

The general rule for all of these cases is to suppress typographic ligatures that cross such morpheme boundaries. For German words, the following exceptions and adjustments apply:¹³

- Should the combination of a main word and suffix give rise to an fi or ffi ligature, this ligature is *not* suppressed. Examples: streifig and affig. However, the fi and ffi ligatures *are* suppressed if two main words are joined together: Schilfinsel, Zupfinstrument, and Baustoffingenieur.
- For some cases potentially giving rise to an fl-ligature at the juncture of a main word (Stammwort) and a suffix, preference is conventionally given to "how the syllables are pronounced and how a word would be hyphenated" (according to the Duden), leading to a suppression of the fl-ligature. For instance, the words schweflig (sulfurous), teuflisch (devilish), and Verzweiflung (despair) have their fl-ligatures suppressed even though in each case the f and l characters belong to the same underlying morpheme, viz., Schwef(e)l, Teuf(e)l, and Zweif(e)l. For these words, the morphemological suffixes are clearly -ig, -isch, and -ung, rather than -lig, -lisch, and -lung. Nevertheless, usage for these and similar cases is *not* to employ the fl-ligature.

This convention also appears to govern the typesetting of words such as knifflig (tricky) and mufflig (grouchy), as well as that of the first-person-singular forms of verbs such as büffeln, löffeln, schaufeln, stiefeln, and zweifeln: they are rendered *without* the fl-ligature, i.e., as büffle, löffle, schaufle, stiefle, and zweifle, respectively.

• If a word could *end* with an fl-ligature even though the f and l technically belong to different morphemes (say, because of an abbreviation that's in effect), the fl-ligature *is* used. E.g., one writes Aufl. *with* an fl ligature. But, when spelled out, the word should be typeset as Auflage. This convention further suggests that it's permissible to use the ffi- and ffl-ligatures in abbreviated names such as Steffi and Steffl even though they do not involve a period.

¹³These adjustments are culled from the rules stated in the *Duden* and various websites that have taken an interest in this subject.

This convention could also be taken to imply that the ft and fft ligatures may be used if they occur at the very ends of words and word fragments—e.g., geschärft, Unbedarftheit, and erschafft—but that they should be suppressed when -f-te, -f-ten, -f-tes, etc. suffixes are involved—e.g., gestreifte, schlürftest, and rafften. All of these suffixes form syllables that start with a "t". Note, though, the deliberate use of the expression "taken to imply" at the start of this paragraph: I have so far *not* encountered any kind of authoritative discussion of this particular typographic concern. For now, the selnolig package *does* break up the ft and fft ligatures if the words include suffixes that are syllables in their own right and start with "te".

• Here's a separate case for which I have not yet found a clear rule. If a morpheme ends in "ft" (e.g., Saft and Luft) and is followed by a suffix that starts with an i, as in saftig and luftig, one could typeset these words as either as saftig and luftig because the ft character pair belongs to a single morpheme, or one could give preference to the way the words are hyphenated and the component syllables are pronounced and thus not use the ft-ligature, i.e., to typeset them as saftig and luftig. For now, the selnolig package implements the latter option. As already noted, however, I have not yet found any authoritative references on how to treat this case. Clear guidance on this typographical issue would be much appreciated.

6 Package options, Additional ligature-related issues

6.1 Main language options

The selnolig package currently offers two main language-specific options:

- english; synonyms: british, ukenglish, UKenglish, american, usenglish, USenglish, canadian, australian, and newzealand.
- ngerman; synonyms: german, austrian, naustrian, swiss, and swissgerman.

These language options may be used either individually or jointly. Indeed, this package's user guide was compiled with both the english and ngerman options set.

See Appendices C and D for the complete listings of the package's English and German language ligature suppression rules.

6.2 Other package options

6.2.1 English language case: The broadf and hdlig options

The ligature suppression patterns listed in Appendix C for English language words are grouped into four parts. The first two parts concern the suppression of various f-ligatures. Part 1 provides a

fairly limited, or "basic", set of patterns that will always be executed, and Part 2 contains a broader set of ligation suppression rules that will be executed if the broadf option is specified.

For English-language documents, only a fairly small number of the f-ligature suppression rules is enabled by default, i.e., if the broadf option is not enabled. Eliminating *all* f-ligatures that cross morpheme boundaries simply does not appear to be a major concern in English-language typography. Whereas many (maybe even most?) people would agree that it advisable not to use the ffi-ligature in words such as chaffinch and wolffish, and not to use the ffl-ligature in words such as scofflaw and offload, there appears to be far less of a perceived need to suppress the fi (ffi) ligature in the far more commonly occurring words that end in f (ff) followed by the -ing, -ish, -ier, -iest, -ily, and -iness particles. The same goes for the fl (ffl) ligature in words that end in f (ff) followed by -ly. That is why only a few f-ligature suppression macros are enabled by default if the english option is set. To enable the broader set of f-ligature suppression rules, users must set the broadf option explicitly.

My choices regarding which f-ligature suppression rules belong to the "basic-f" and "broadf" groups are almost entirely pragmatic. They are certainly not based on any overriding English-language typographic principles (which, possibly, don't even exist for the case at hand). However, if anyone happens to have a strong view on whether either *fewer* or *more* f-ligature suppression macros should be included in the "basic" group—especially if you can provide references to such discussions in learned circles—I would love to hear from you.

Part 3 of the file seinolig-english-patterns.sty, which is enabled if the hdlig option is set, provides ligature suppression patterns for the "historic" (Adobe uses the term "quaint") ct, st, and sp ligatures, in words such as arctangent (better than arctangent), painstaking (better than painstaking), and display (better than display). The sp ligature is also suppressed for words of Greek origin containing the sph character triple, such as atmosphere and hemisphere, because in these cases the ph character pair (which derives from the Greek letter ϕ , or φ) is pronounced like "f" and should not be obscured by a preceding sp ligature.

Setting the hdlig option also enables ligature suppression rules for ligatures such as *th*, *at*, and *et*. These ligatures might occur in words such as *lighthouse* and *pothole*, *aromatherapy* and *albatross*, and *ninety* and *nonetheless*. Ligature suppression rules are provided for the following discretionary ligatures: *th*, *at*, *et*, *as*, *is*, *us*, *sk*, *ll*, and *fr*. Part 3 of Appendix C lists these rules.

Part 4 of this file, which is also processed if the hdlig option is set, deals with cases where one discretionary typographic literature, say as, pre-empts the use of a typographic ligature, say st or sp, in words such as fast/fast and clasp/clasp. Note that the issue being addressed in this part is not that of a ligature crossing a morpheme boundary but of the pre-emption of one typographic ligature by another ligature within the same morpheme. This issue is discussed in more detail in Section 6.6.

¹⁴Examples of such words are surfing, oafish, leafier, goofiest, fluffily, and goofiness.

¹⁵Examples are aloofly and gruffly.

6.2.2 Supplentary hyphenation exception patterns

TEX's hyphenation algorithms are widely acknowledged to be very good. However, for the English language case at least, it tends to miss quite a few permissible hyphenation points when dealing with words that end in -f-ing, -ff-ier, -f-iest, -f-less, -f-like, etc. Hyphenation exception lists are provided in the files selnolig-english-hyphex.sty and selnolig-german-hyphex.sty, respectively, for English and German words.

The German-language hyphenation exception list is the shorter of the two. This is because it is assumed that writers of German-language documents use the babel package while setting the option ngerman option (or one of the related options); doing so also loads specialized hyphenation patterns suitable for German text.¹⁶

It is possible to instruct selnolig *not* to load the package's hyphenation exception lists. You may want to do so, say, if you must use UK-English hyphenation patterns and therefore mustn't make use of the US-English hyphenation patterns provided by the package. (To the best of my knowledge, though, most of the hyphenation patterns indicated in selnolig-english-hyphex.sty are common to UK and US English.) To skip loading the additional hyphenation patterns when invoking the selnolig package, you should specify the option noadditionalhyphenationpatterns.¹⁷

As was already noted in Section 2.3, if you use the babel package with, say, the ngerman option, be sure to load selnolig package *after* the babel package. That way, the selnolig package's additional hyphenation exception patterns won't be overridden by babel's settings.

Incidentally, if the files selnolig-english-hyphex.sty and selnolig-german-hyphex.sty are located in a directory that's in the search path of your TeX distribution, these packages may be loaded by users via the usual \usepackage statements without having to load the entire selnolig package.

6.3 Composite words made up of two different sets of primitive words

More so in German than in English, there may be composite words which are made up of two different pairs of primitive words. For instance, the words Saufladen and Wachstube may be constructed as Saufladen/Sau-fladen and as Wachs-tube/Wach-stube, respectively. In one case, using the fl and st ligatures would be wrong; in the other, using the ligatures would help greatly in indicating the intended meaning of the composite words. For words such as the ones given above, software isn't—and won't be for a quite a while to come—smart enough to "know" on its own which possible meaning is intended. Writers, of course, can choose to insert explicit hyphen characters to indicate unambiguously the intended meaning.

It turns out that if the ngerman option is set and the babel package is loaded as well, the selnolig package will break up the fl ligature in Saufladen but not the st ligature in Wachstube,

¹⁶As was already noted earlier, the semonig package is also compatible with the hyphsubst package.

¹⁷I am obviously not trying to make it too easy to invoke this option ...

i.e., the words will be typeset as "Saufladen" and "Wachstube", respectively. If that's not what you want, you'll need to mark up the words explicitly, say as follows: Sau\mbox{f1}aden and Wachs\breaklig tube.

A related case is that of the word Chefinnenleben, which can be constructed as Chefinnenleben (lives of female bosses) or as Chef-innenleben (inner life (or lives) of a boss): the particle "innen" could either be a suffix to "Chef" or a prefix to "Leben". The macros of the selnolig package are set up, by default, *not* to break up the fi ligature in words such as Chefin and Chefinnen, in keeping with the rule that the fi ligature is permitted if the suffix starts with an "i". In contrast, it will break up the fi ligature in the longer words Chefinnenleben and Chefinnenräume, as in these cases the assumption is that the innen particle acts as a prefix to the final part of the composite word. If that's *not* what you want, i.e., if you do mean to discuss various things pertaining to female bosses, be sure to use \mbox{fi} instructions where appropriate. Better yet, use hyphens and write the words in question either as Chef-Innenleben and Chef-Innenräume or as Chefinnen-Leben and Chefinnen-Räume, respectively.

6.4 Providing additional ligature suppression patterns

As already noted, I do not claim that the non-ligation search-and-insert patterns set up in semoligenglish-patterns.sty and semolig-german-patterns.sty are complete or, for that matter, ever will be entirely complete. If you come across words containing ligatures that ought to be suppressed but aren't caught, it is straightforward to create one or more new non-ligation rules to deal with the cases you've discovered.

Suppose, say, that you need to prepare a special edition of Thomas Mann's novel "Der Tod in Venedig" and that you have chosen to use an "Antiqua" (Roman) font since fewer and fewer people nowadays can manage with ease to read text set in a period-appropriate blackletter font. During these preparations, you might notice that the novel contains the word inbegriffleitend and that the selnolig package does not (yet) appear to include a macro to suppress the unwanted ffl-ligature for this word. To address this problem, while simultaneously creating a search pattern that will also catch cases of inappropriate ffl-ligatures in the (hopefully quite a bit more common) words Jugendtreffleiter and Kunststoffleitung, you could add the following \nolig macro to your document's preamble:

\nolig{ffleit}{ff|leit}

With this macro in place, the words would now be typeset as inbegriffleitend, Jugendtreffleiter, and Kunststoffleitung.¹⁹

¹⁸This word really does occur in the aforementioned novel!

¹⁹The file selnolig-german-patterns.sty provides the macro \nolig{fleit}{f|leit} to cover these and further words.

6.5 How to use the selnolig package to suppress certain ligatures *globally*

The main purpose of the selnolig package is, obviously, to disable certain ligatures selectively. However, it can also be used to suppress ligation globally for selected character pairs.²⁰

For instance, suppose that you are typesetting a Turkish text, which features both a dotted and a dotless i, *viz.*, "1". I understand that in Turkish typesetting practice, *no* fi and ffi ligatures should be employed so as not to create doubt regarding which "i" character follows the "f" character. However, other f-ligatures (such as ff, fl, and ffl) may presumably be employed, because doing so wouldn't create similar readability and intelligibilty problems. To address the global need not to use fi and ffi ligatures while keeping other f-ligatures in play, one could issue the command

```
\nolig{fi}{f|i}
```

in the preamble of the document.

Or, suppose that you have a font that provides ligatures for the fb, fh, fj, and fk character pairs as well as, possibly, the ffb, ffh, ffj, and ffk character triples. If you wanted to suppress the four former f-ligatures globally (and also break up the latter ligatures as ff-b, ff-h, ff-j, and ff-k, respectively), you could do so by issuing the following commands:

```
\nolig{fb}{f|b}
\nolig{fh}{f|h}
\nolig{fj}{f|j}
\nolig{fk}{f|k}
```

In fact, these commands are provided automatically if the package's ngerman option is set.²¹ This is done because I was unable to come up with a single instance of a *German* language word involving these character combinations that doesn't also involve a morpheme boundary collision.

Of course, your document may contain some *non-German* language words as well, for which you would not necessarily want to suppress these ligatures. Suppose, say, that you need to typeset the name Kafka and do not wish to suppress the fk-ligature for this specific word. To override the global setting created by the \nolig{fk}{f|k} macro, you could write each instance of this word as Ka\mbox{fk}a to generate Kafka instead of Kafka. Alternatively—and this is the method implemented by the selnolig package—one may provide suitable \keeplig macros to preserve the fk-ligature in names such as Kafka, Safka, Piefke, Potrafke, Sprafke, Shirafkan, and Tirafkan.

Or, suppose the selnolig package's ngerman option is enabled and your document features some words of *Nordic* origin containing the fj character pair, such as Sognefjord and Dovrefjell. Observe that because the fj character pair contained in these words does not span a morpheme

²⁰I first became aware of the potential need for such a feature after reading Frank Mittelbach's posting, Suppress certain ligatures generally, on tex.stackexchange.com.

²¹These four macros are also enabled if the selnolig package's english and broadf options are set.

boundary, the fj-ligature should not be broken up, i.e., the words should be typeset as Sognefjord and Dovrefjell, respectively. \keeplig macros are therefore provided for words containing the particles fjord, fjör, fjell, and fjäll as well as for names such as Eefje, Sufjan, Prokofjew, and Astafjew.

6.6 What if one ligature pre-empts a subsequent, more appropriate ligature?

If a font provides many discretionary ligatures, the likelihood increases that the use of a ligature for the first two characters of a *character triple* might pre-empt the use of a more appropriate ligature for the last two characters of that triple.²² In this section, we examine the use of \nolig instructions to address this contingency, focusing on cases of \$1, \$1, th, and ta character pairs being preceded by character pairs (for which the font provides ligatures) that end in \$1 or \$1,\$ respectively. This focus is dictated largely by the discretionary ligatures provided by the text font used for this user guide (Garamond Premier Pro). Other ligature-rich fonts may provide further possibilities for one ligature inappropriately pre-empting that for a trailing character pair.²³

6.6.1 Ligatures for as, is, and us that pre-empt an st ligature

Suppose that the text font in use provides ligatures for the *as*, *is*, and *us* character pairs as well as for the *st* character pair. By TEX's rules for forming typographic ligatures, words that contain the character *triples* ast, ist, or ust will see the first two characters ligated, pre-empting the use of a typographic ligature for the trailing *st* character pair. There are three separate reasons why this outcome may not be desirable.

First, given the rather distinctive look of the *st* ligature, the word stochastic may look a bit odd if the *st* ligature is used only once—*stochastic*—simply because the *as* ligature pre-empts the second *st* ligature; readers may prefer the look of *stochastic*. Second, non-use of the *st/st* ligature may be undesirable if the same word occurs twice and in close visual proximity, once set in the

²²To be sure, the issue of ligature pre-emption is not limited to "discretionary" ligatures; it can also occur with "common" f-ligatures. Suppose that a certain font provides ff, fi, and fl ligatures but no ffi and ffl ligatures, and consider how words containing ffi and ff1 character triples will be typeset. Left to its own devices, TEX would let the leading ff-ligature pre-empt the trailing fi- and fl-ligatures, resulting in typographically incorrect outcomes for words such as wolffish (better: wolffish), safflower (safflower), auffinden (auffinden) and Schaffleisch (Schaffleisch).

²³For the Garamond Premier Pro text font, I've discovered the following preculiar exception to the general rule that TEX always gives precedence to a ligature for the first two characters of a character triple: for the character triple fis (as in fist and fish), TEX gives preference to the trailing is ligature over the preceding fi ligature, causing these words to be typeset as fish and fist, respectively. I can't tell if this outcome is a conscious design feature or a bug.

For now, selnolig is set to override this behavior, i.e., to always give preference to the leading fi ligature over the trailing fi ligature for words that contain the strings fist and fish; hence, they'll be rendered as fist and fish, respectively. Note that if the broadf option was set, this setting implies that words such as fist as fist, fi, fi

upright font shape—for which there are no ligatures for the as, is, and us character pairs, and hence for which the issue of ligature pre-emption doesn't arise—and once in italics: must vs. must; readers may prefer the look of must vs. must. Taking this matter to a (slight?!) extreme: Do you prefer the look of Do fast festive fists foster fustiness? or that of Do fast festive fists foster fustiness?

Third, there may be cases where an *as* ligature not only pre-empts a subsequent *st* ligature but also spans a morpheme boundary, as in the words *infrastructure* and *seastrand*.²⁴ For such words, the *as* ligature should probably be suppressed in any case to increase the words' legibility: *infrastructure* and *seastrand*.

If the hdlig option is set, it is assumed that you prefer giving preference to the distinctive-looking *st* ligature over *as*, *is*, and *us* ligatures. The following commands are therefore provided:²⁵

```
\nolig{ast}{a|st}
\nolig{ist}{i|st}
\nolig{ust}{u|st}
```

6.6.2 Ligatures for *as, is*, and *us* that pre-empt an *sp* ligature

The same three reasons for not letting as, is, and us ligatures pre-empt an st ligature also apply to the case of the equally distinctive looking st ligature. The selnolig package therefore provides macros to ensure the use of the trailing st ligature in words such as clasp, hast, histpanic, rast berry, teast poon, wast, crist, lisp, whister, wisty, and cust. [Still need to figure out the following: Why isn't the st lig shown in clasp and lisp in this list, even though the as and is ligs aren't being used and hence can't be pre-empting the st lig?!]

6.6.3 Ligatures for *at* and *et* that pre-empt a *th* ligature

Suppose that a font provides ligatures for the *at*, *et*, and *th* character pairs. By TEX's rules for forming ligatures, without special intervention the word mathematics will be typeset as *mathematics* rather than as *mathematics* because the *at* ligature pre-empts the *th* ligature. The same happens for words such as *bath*, *Kathryn*, and *pathology*. Given the prevalence and distinctive pronuciation of the th character pair in the English language, as well as the high frequency of this character pair in

²⁴This case was already noted in Footnote 22, where two words are noted for which the ff-ligature, which might improperly pre-empt fi- and fl-ligatures, happens to span a morpheme boundary.

²⁵Be aware, though, that the second of these three commands, while correct for most words that contain the string ist, unnecessarily suppresses the *is* ligature for words where the *st* character pair crosses a morpheme boundary. Examples of this case are words that start with *dis-t...*—e.g., *distend, distribute, distrust, disturb*—or with *mis-t...*—e.g., *mistake, mistranslate, mistype.* (Note that the st/st ligature is already—and appropriately!—suppressed for these words.) At this time there are no plans to address this (overall minor?) problem.

²⁶A longer list of words for which the *at* ligature pre-empts the *th* ligature is given in the ancillary document selnolig-english-test.pdf.

words of Greek origin (for which the Latin-alphabet th character pair derives from the Greek character θ , or ϑ), it seems undesirable to let the *at*-ligature pre-empt the *th* ligature for these words.

Fixing the *at-th* ligature pre-emption issue globally, e.g., via \nolig{ath}{a|th}, is not completely innocuous because doing so will also suppress the *at* ligature for words such as boathook, for which the *th* ligature would span a morpheme boundary and thus shouldn't be employed anyway. For such words, then, there's no need to suppress the *at* ligature. These cases, fortunately, can be dealt with by providing \keeplig macros that deliberately let the *at* ligature take precedence over the trailing *th* ligature.

Suppressing an *et* ligature in favor of a subsequent *th* ligature via \nolig{eth}{e|th} is almost universally correct, either because the *th* ligature *should* take precedence—as in the words *ethics*, *methane*, and *teeth*—or because the *et* ligature would cross a morpheme boundary and hence shouldn't be used anyway, as in the words *forethought* and *rethink*.

I say that it's *almost* universally correct to do so because there are some words, such as Beethoven, prophethood, and sweetheart, for which the *th* ligature would be inappropriate anyway and hence the use of the *et* ligature would be unproblematic. To address this issue, \keeplig macros are provided for these words, deliberately letting the *et* ligature take precedence over the *th* ligature and resulting in them being typeset as *Beethoven*, *prophethood*, and *sweetheart*, respectively.²⁷

6.6.4 Ligatures for *at* and *et* that pre-empt a *ta* ligature

There seem to be only very few words for which an *at* ligature might inappropriately pre-empt a more important *ta* ligature. One such word is atap, which may be more readable if it's typeset as *atap* rather than as *atap*.²⁸ Because of the apparent paucity of such cases, I have decided for now not to provide specific ligature suppression rules to handle them.

To the best of my (admittedly not exhaustive) knowledge, all words for which an *et* ligature might inappropriately pre-empt the use of a trailing *ta* ligature are words for which the *et* ligature crosses a morpheme boundary and hence probably shouldn't be used anyway.²⁹ As such, the *et*-related ligature suppression rules already in place, which are set up to deal with morpheme boundary crossing cases, should suffice to catch these cases as well.

²⁷Note that this method works if the font being used provides *both et* and *th* ligatures. If the text font you employ provides only the *th* ligature but not the *et* ligature, these \keeplig macros should be disabled.

²⁸It's not advisable, however, to specify a macro such as \nolig{atap}{a|tap} to address this case, because of words such as *catapult* and *catacomb*, for which the use of the *at* ligature is presumably innocuous. Somebody please correct me if this assumption is not correct.

²⁹Examples are betake, betatter, bristletail, caretaker, cheetah, detach, detail, detain, dovetail, foretaste, horsetail, pretake, pretax, retable, retack, retard, retarget, timetable, whitetail, and wiretap. Incidentally, the author of the selnolig package has a slight preference for seeing his surname typeset as *Loretan* rather than as *Loretan*...

7 Further issues

7.1 Known bugs

Remark: The bugs in the following list may turn out to be related, i.e., may be caused by a single bug in the package's lua code.

- The \nolig search-and-nolig-whatsit-insertion patterns do not appear to work properly on the final word in the argument of a command (e.g., \footnote{} and \section{}) unless that word (including any trailing punctuation mark) is followed by one or more space characters before the closing curly brace of the command's argument is encountered.
 - For instance, the fl ligature in "kopflos" is not broken up by either \footnote{kopflos.} or \section{Kopflosigkeit}. The package does work as expected if the commands are modified to \footnote{kopflos.} and \section{Kopflosigkeit}.
- 2. The \nolig search-and-insert patterns also don't seem to work on words (including, if present, any trailing punctuation marks) that are followed immediately by a % (comment) character. The workaround is the same as for the preceding bug: be sure to leave one or more spaces between the word and the comment character.
- 3. If the content of an \item directive in an itemize or enumerate environment *ends* with a word (including an associated punctuation mark) that contains a ligature that should be suppressed —i.e., if it is followed immediately by another \item directive or an \end{itemize} or \end{enumerate} statement—the ligature suppression again fails. The remedy in this circumstance is to leave a blank line between the end of one \item's content and the next \item instruction or the \end{itemize} or \end{enumerate} instruction.
- 4. If the final word (again, possibly, with an associated punctuation character) in a sentence immediately *prior* to the start of an enumerate, itemize, or other such environment contains a ligature that should be suppressed, the \nolig macro again will not work properly. The recommended remedy is to leave a blank line between that sentence and the start of the environment in question. Inserting an "invisible" instruction, such as \vphantom{x}, also works.

I'm not sure if the following matter constitutes a bug or "just" a case of incompatibility between two packages. The selnolig package does not appear to interact well with the ngerman package; however, as was noted earlier, it interacts nicely with the babel package (with one or more of the ngerman, german, austrian, and naustrian options set). Unless someone can convince me that using the ngerman package is truly preferable to using the babel package with one of the available German language options, I probably won't bother figuring out how to fix this incompatibility.

7.2 Writing ancillary information about the package's activity to the .10g file

By default, none of the inner workings of the selnolig package are written to the .log file. However, if you execute the command \debugon, detailed information about each pattern match that is encountered is written to the .log file. Incidentally, because of the built-in redundancy of some of the \nolig command, it is possible that more than one pattern match will be found for a given word. E.g., for the verb "auffahren", two separate \nolig commands simultaneously apply, and the following lines are written to the .log file:

```
pattern match: auffahren - auff
pattern match: auffahren - ffahr
Do ligature suppression for: auffahren
Inserting noliga whatsit before glyph: f
```

It is also possible that words with more than one ligature suppression point are found. For example, if the word "Auflaufform"—which happens to have both an fl- and an ff-ligature that should be suppressed—is encountered, the following lines are written to the .log file; note that in this case, two separate \nolig commands "catch" the fl and ff ligatures:

```
pattern match: Auflaufform - fform

pattern match: Auflaufform - Aufl[aäeioöuü]

pattern match: Auflaufform - auff

pattern match: Auflaufform - flauf

Do ligature suppression for: Auflaufform

Inserting noliga whatsit before glyph: 1

Inserting noliga whatsit before glyph: f
```

To terminate the writing of the debugging-related information to the .10g file, one may execute the command \debugoff.

Having the commands \debugon and \debugoff could be useful if you're writing your own \nolig and \keeplig commands and discover some ligature suppression problems which occur only in a small subset of your document. By bracketing this subset with a pair of \nolig and \keeplig commands, you limit the writing of debugging-related information to the .log file, making the amount of information you'll need to plow through hopefully be quite manageable.

7.3 Suspending and restarting the operation of selnolig's macros

By default, selnolig's macros are switched on if the package is loaded. If you want to suspend their operation at some point in the document, you may issue the command

\selnoligoff

Conversely, if selnolig's macros need to be switched back on, you should issue the command

\selnoligon

Incidentally, encasing a \selnoligoff instruction inside a TEX "group"—something that's delimited by a pair of curly braces or by \bgroup and \egroup statements—will not switch selnolig's macros back on after the end of the TEX group is reached. This is because selnolig's main lua function is implemented as a callback routine. Adding this lua function to and removing it from the callback list, which is what \selnoligon and \selnoligoff do, is not affected by TEX groups. That's why it's necessary to issue a \selnoligon command to switch selnolig's macros back on.

7.4 Lists of words fitting German and English language non-ligation patterns

Extensive lists of German and English language words for which one or more ligatures should be suppressed are provided in the files selnolig-german-wordlist.tex and selnolig-english-wordlist.tex.^{3°} Obviously, I can't and won't make a claim that either of these lists is complete. Suggestions for additional words are always welcome.

The files selnolig-german-test.tex and selnolig-english-text.tex are "driver programs" that load the selnolig package and then run it on the respective lists of German- and English-language words. To compile the driver programs, be sure to use LuaLTEX because they make use of the selnolig package.

³⁰I started the list of German language words with the examples provided by the rmligs script, but have come up with quite a few more words since then.

Appendices

A The package's main style file: selnolig.sty

D German-language ligature suppression patterns: selnolig-german-patterns.sty

Introductory note: To accommodate the practice of Swiss-German writers of not using the "ß" character (and using "ss" in its place), all search-and-insert strings that contain an "ß" character are duplicated with equivalent search-and-insert strings containing "ss".

```
